

# STURDY STREET

Street has been designed to meet the growing demand of the public who seek convenient access to recycling centres within their communities, and local authorities who require greater storage facilities in public spaces. The aesthetic appearance of Street blends with its surroundings, whether in a busy city street, housing development or public park.

The stylish design can incorporate distinctive recycling messages to allow members of the public to quickly and easily identify the separate waste streams and prevent cross contamination, or be used as a higher volume collection point for general waste.

With a larger storage capacity than traditional street-scene litter bins, Sturdy Street reduces the risk of overflowing during peak periods, which often leads to a larger littering problem in public spaces. The Street houses an 1100 litre or 1280 litre container and is designed to match the modern urban environment. The Sturdy Street stands out but doesn't dominate and is perfectly placed to encourage the public to recycle on the go
