

# STURDY Rainwater Filter

Introducing The New STURDY Rainwater Filter.

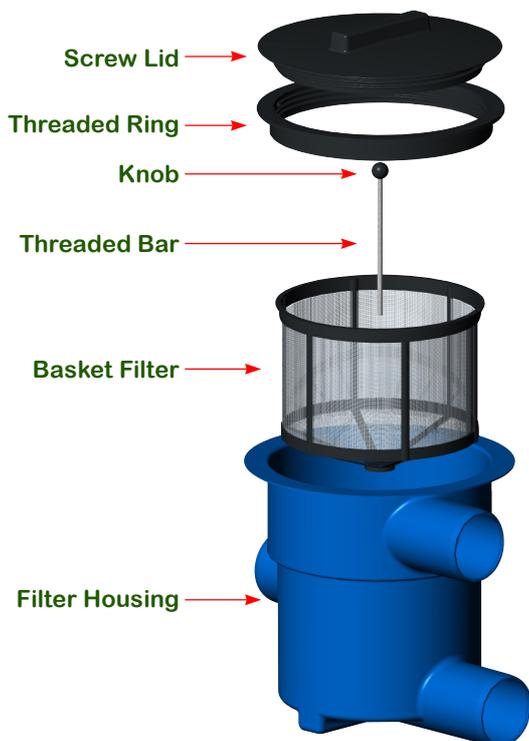

Product Code  
457-A

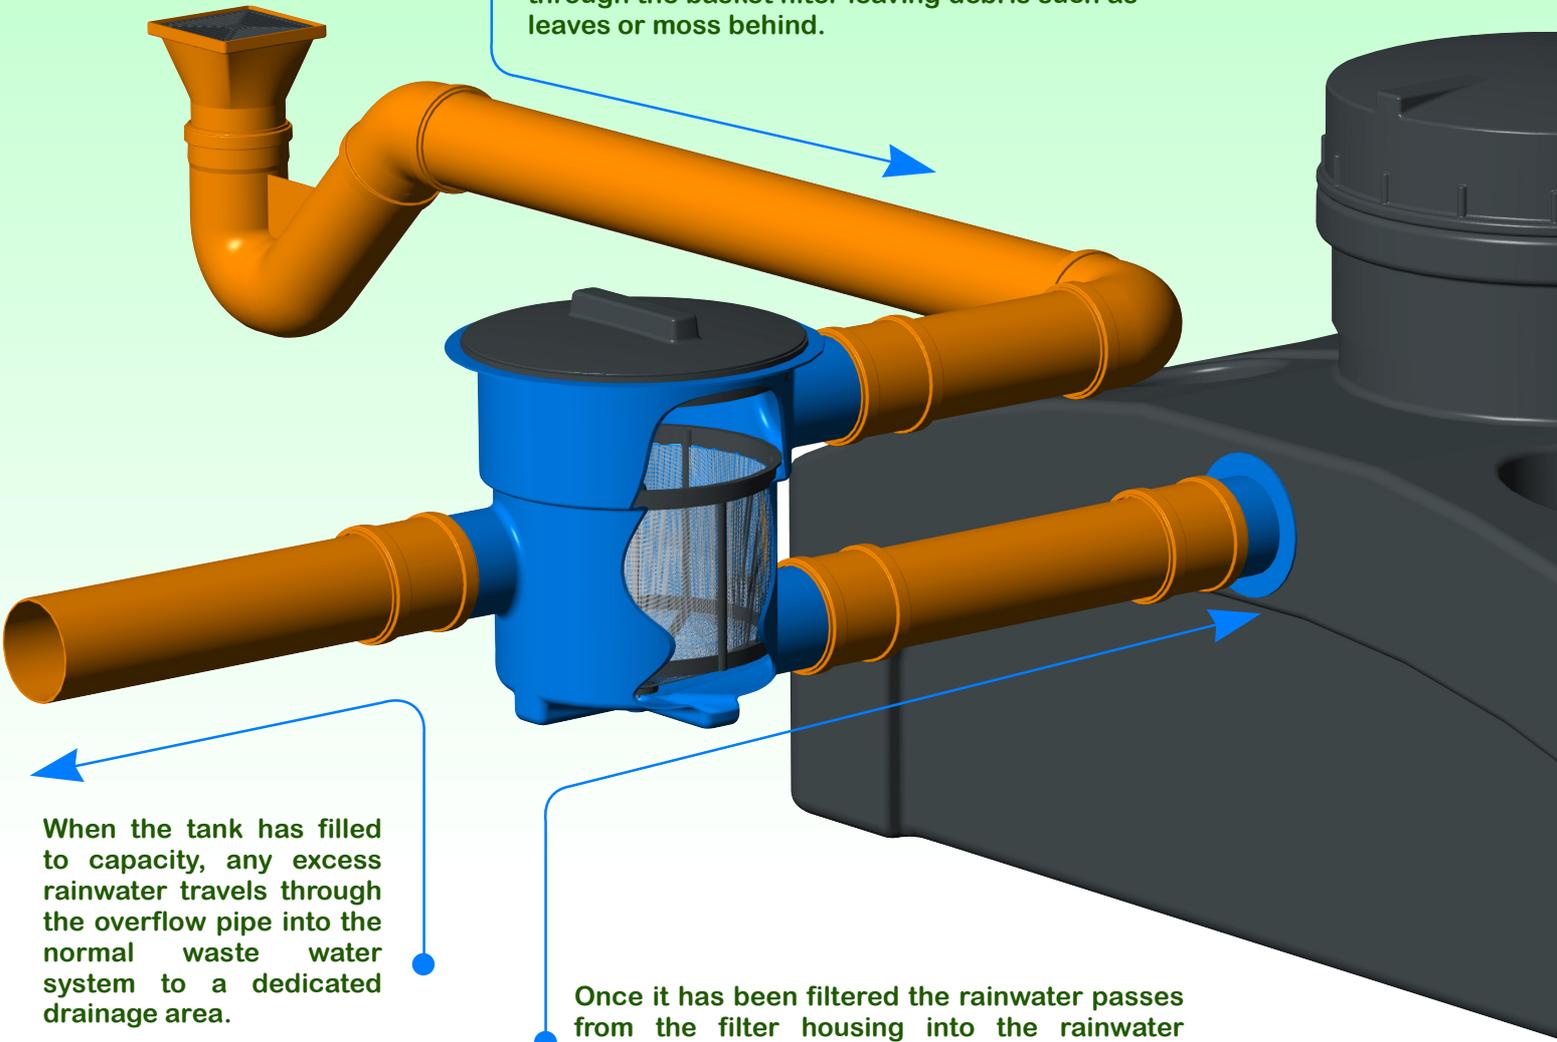

## Product Features/Specifications

- The Sturdy Rainwater Filter has been designed to filter large debris such as leaves or moss from harvested rainwater.
- The filter should be located before the rainwater enters your holding tank.
- This filter allows for all the rainwater from your building to be filtered once all your downpipes are diverted into the filter.
- The basket filter itself can be removed for cleaning through the lid.
- The lid is threaded which means it can be unscrewed to allow easy access.
- The Rainwater Filter accommodates standard 4" Wavin Connections.
- There is an inlet, an outlet and an overflow situated on the sides of the product.
- The product is manufactured from UV stabilised MDPE which means there will be no colour fade.

# STURDY Rainwater Filter

Rainwater gathered from one or more gullies travels through the pipe work system into the Rainwater Filter. Here the rainwater passes through the basket filter leaving debris such as leaves or moss behind.

When the tank has filled to capacity, any excess rainwater travels through the overflow pipe into the normal waste water system to a dedicated drainage area.

Once it has been filtered the rainwater passes from the filter housing into the rainwater storage tank. A special moulded connection is added to the tank to accommodate a 4" pipe.
